

## Task Brief: Lego Inventory Creation

**Dear Team,**

As you know, we're launching a new market line where we'll be receiving bulk Lego pieces from customers who no longer need them. These pieces will be resold, and to manage this operation smoothly, we'll be using Google Sheets.

I'm giving you a bag of around 100 Lego pieces. Your task is to create an inventory for these pieces. Please start creating the database based on the following variables:

Name	Description
Color	The color of the piece
Is duplo?	Whether the piece is duplo or not
Size type	The type of piece: brick or plate
Base shape	The shape of the base
Number of studs	The number of studs on the piece
Base dimensions	The dimensions of the base using number of studs as the unit. Avoid to use length units.
Has slope?	Whether the piece has a slope or not
Slope degree?	The degree of the piece with slope
In stock	How many pieces are in the bag.

Feel free to add other variables if you think it can help to understand better the database, but do not modify the existing ones.
